PROPOSED SOLUTION

Introduction

The proposed solution focuses on using **ServiceNow configuration tools** to enforce mandatory fields dynamically. Instead of using scripts, the solution uses **UI Policies**, which allow administrators to control form behavior based on specific conditions.

Overview of the Solution

The system will automatically enforce the **Priority field as mandatory** whenever the **Incident State is changed to "In Progress"**.

This ensures that every incident has a defined priority before it is processed further.

Implementation Steps

1. Log in to the **ServiceNow platform**.
2. Create a **new Update Set** to track configuration changes.
3. Navigate to **System UI → UI Policies**.
4. Create a **new UI Policy** for the Incident table.
5. Set the condition:

State = In Progress

6. Add a **UI Policy Action** for the **Priority field**.
7. Set the field property to **Mandatory = True**.
8. Save the configuration.
9. Verify that the changes are captured in the **Update Set**.
10. Export the Update Set as **XML** and import it into another ServiceNow instance.

Flowchart

Start
↓
User opens Incident Form
↓
User changes Incident State to **In Progress**
↓

System checks **UI Policy Condition**
↓

Is State = "In Progress"?

YES → Make **Priority field Mandatory**
NO → Continue normally

↓
User enters Priority value
↓
Incident record saved successfully
↓
End

Benefits of the Proposed Solution

- Prevents incomplete incident updates
- Ensures accurate incident prioritization
- Improves system reliability
- Easy configuration without coding
- Supports configuration migration using Update Sets
